Sime Darby Property University Hackathon 2026 · People track

1. The Problem

Who is affected and why it matters

Unnoticed in a crisis

Residents who live alone, especially seniors, can go unnoticed for hours after a fall or health event.

Passive, individual apps

Health apps wait to be opened and ignore neighbours, parks, clinics and guardhouses.

No township signal

Management cannot see who is isolated or where shade, lighting and benches are missing.

Malaysia is ageing, so more households with older residents are coming to every township.

2. Target User

Who benefits, and their challenges

Older residents

People living alone, like Pak Cik Ahmad, 72. Want help without losing independence.

Families

Worry from afar. Need clear, timely alerts.

Neighbours and staff

Volunteers, guardhouse and management who can respond.

Busy residents

Want affordable healthy meals, short workouts and stress breaks.

Challenges: low digital confidence and language needs (BM, English, Mandarin, Tamil).

3. Our Solution

An AI health agent that uses the township itself as the health system

Check-in Circle

Daily check-in; escalates to neighbour, guardhouse, family if missed

Daily Wellbeing

Eat, Move, Mind, using local food stalls, parks and tracks

Neighbour matching

Walking buddies and caregiver circles, opt-in

Agentic actions

Reminders, clinic request, report a broken light

Township Insights

Anonymised data shows where to add shade, lighting, programmes

4. Innovation

What makes it different

Proactive

The agent checks in, acts and escalates. It does not wait to be asked.

Township-aware

Uses real parks, tracks, food stalls, clinics and guardhouses of one community.

Community-based

Neighbours are part of the solution, with consent at every step.

Closes the loop for the developer: resident behaviour becomes facility decisions. Builds on MOH guidance (MyNutriDiari 2, Malaysian Healthy Plate) with a conversational layer.

5. How it Works

Resident

Telegram (WhatsApp or township app later)

AI agent

Tools: check_in, escalate, find_buddy, report_issue, get_air_quality

Scheduler and data

Escalation timers, consent, circles, events

Insights dashboard

Anonymised heatmap and recommended actions

Check-in ladder: 08:00 check-in → 08:05 reminder → 08:20 neighbour → 08:35 guardhouse → 08:40 family

Every contact is chosen by the resident and has consented. Each township is a configuration pack (map, facilities, volunteers).

6. Impact

Who benefits and what outcomes we aim for

Residents

Earlier help, healthier routines, less loneliness.

Families

Peace of mind with contextual alerts.

Management

Faster, better-informed response with existing staff.

Sime Darby Property

Higher liveability and retention; facilities placed using data.

Proposed measures: check-in response time, weekly active participants, loneliness (UCLA 3-item), facility actions taken.

7. Feasibility

Can it realistically be implemented?

Low cost

Prototype built on free tools. Uses existing guardhouse and management staff.

Safe and private

No diagnosis. Red flags go to 999. Opt-in, revocable consent. Designed for PDPA.

Risks handled

Tunable timing for false alarms, family-assisted setup, rotating volunteers.

Stakeholders: Sime Darby Property township team, guardhouse, resident volunteers, partner clinics.

8. Implementation

Pilot: 500 households, 3 months, one township agreed with Sime Darby Property

Weeks 1–3: Onboard

QR codes at guardhouses and halls. Train volunteers. Set township configuration pack.

Weeks 4–10: Run live

Check-ins and escalation live. Weekly review of alerts and feedback.

Weeks 11–12: Evaluate

Measure response time, participation, loneliness. Report to Sime Darby Property.

Scale: bundle into township management services; clinic and pharmacy partners as optional revenue. Next build step: working Telegram bot.

Why Our Team Should Win

SikLemau turns a township into a health system. Instead of another passive app, it checks on residents, escalates when something is wrong, and connects neighbours through shared health goals. It is practical: it uses existing guardhouse staff, free tools and a configuration pack for each township. It is safe and private by design, and gives Sime Darby Property anonymised insights to place shade, lighting and programmes where residents need them. Our prototype demonstrates the full journey, and our pilot plan is ready to start.
